EDUCATION

New York University, Courant Institute of Mathematical Sciences

Master of Science in Computer Science

New York, NY

Graduation Date: May 2028

University of Michigan

Bachelor of Science in Computer Science

Ann Arbor, MI

Graduation Date: May 2025

TECHNICAL SKILLS

Programming Languages: Python, C/C++, Go, JavaScript/Typescript, Java

Frameworks and Tools: Linux/Unix, React, Node.js, Flask, SQL, MongoDB, Supabase, Git, Redis, Docker

Languages: Mandarin (Native), Korean (Native), Japanese (Fluent), English (Fluent)

EXPERIENCE

Linux Foundation (OpenSSF)

May 2026 – Current

Software Engineer Intern, LFX Mentorship

remote

- Contributed security-focused features for gittuf, an OpenSSF repository security framework that enables policy-driven software supply chain protections across Git hosting platforms
- Researched a delta compression strategy for gittuf's encrypted read-access prototype, exploring storage efficient synchronization while preserving repository confidentiality
- Owned the end-to-end development of gittuf visualizer, including UI/UX design, full-stack development, deployment, and technical decisions across the application stack
- Re-designed the gittuf Terminal User Interface (TUI) to streamline developer workflows and improve accessibility

Everstory

May 2025 – Current

Founding Software Engineer (part-time)

Ann Arbor, MI

- Deployed 20+ FastAPI REST endpoints integrated with Supabase Auth, role-based access control, Amazon S3, and OpenAI Whisper to support secure, voice-powered media search
- Built a semantic search pipeline using OpenAI embeddings and pgvector (HNSW), replacing exact-keyword matching with approximate nearest neighbor retrieval over natural-language queries
- Built a CI/CD pipeline with GitHub Actions to automatically provision Supabase databases and execute pgTAP integration tests on pull requests, reducing integration errors by 35% before deployment

Ubiquant

Oct 2025 – Dec 2025

Trading Reliability Engineer

New York, NY

- Monitored distributed trading systems across US and Asian markets using Prometheus and internal monitoring tools, resolving 20+ daily production alerts via Linux-based debugging to identify root causes
- Maintained PTP/NTP time-sync across servers, ensuring millisecond-level accuracy for real-time market data
- Built a Python crawler to scrape and analyze 2,000+ internal trading event logs and visualize data trends

F5 Networks

July 2024 – Oct 2024

Software Engineering Intern

San Jose, CA

- Prototyped a session-aware C component using Redis and mTLS enabling distributed lookup/deletion across BIG-IP Next instances, cutting cross-instance session resolution time
- Implemented the dSSM proxy to enable cross-instance session sync via Pub/Sub and multicast, then validated the full create/lookup/delete lifecycle across distributed RedisDB nodes
- Worked on the BIG-IP Next Access team to resolve 5+ critical bugs and close support tickets for the BIG-IP Next product by analyzing Gitlab CI/CD pipeline logs, with fixes shipping in production

PROJECTS

Budget-Constrained Deep Research Agent | Python, OpenAI API, JavaScript

March 2026 - May 2026

- Built a budget-aware AI research agent for long-form report generation under fixed token and cost budgets
- Implemented retrieval routing, evidence compression, and memory management to maximize information coverage

Tamagotchi - OS | C, Linux

May 2026 - Current

- Developed a Linux kernel device driver exposing a virtual pet via `/dev/pet` with timer based state management
- Implemented user-kernel communication, procfs diagnostics, and event logging for pet monitoring and interaction
